Notes

Pour le dossier **Entier**:

- Faire un sommaire
- Faire une énumération des étapes de manière plus conventionnelle
-

Pour le dossier Windows :
Appliquer l'énumération - Done
Analyser les failles Microsoft **avant** et **après** mise à jour pour démontrer l'importance de garder à jour le système d'exploitation.

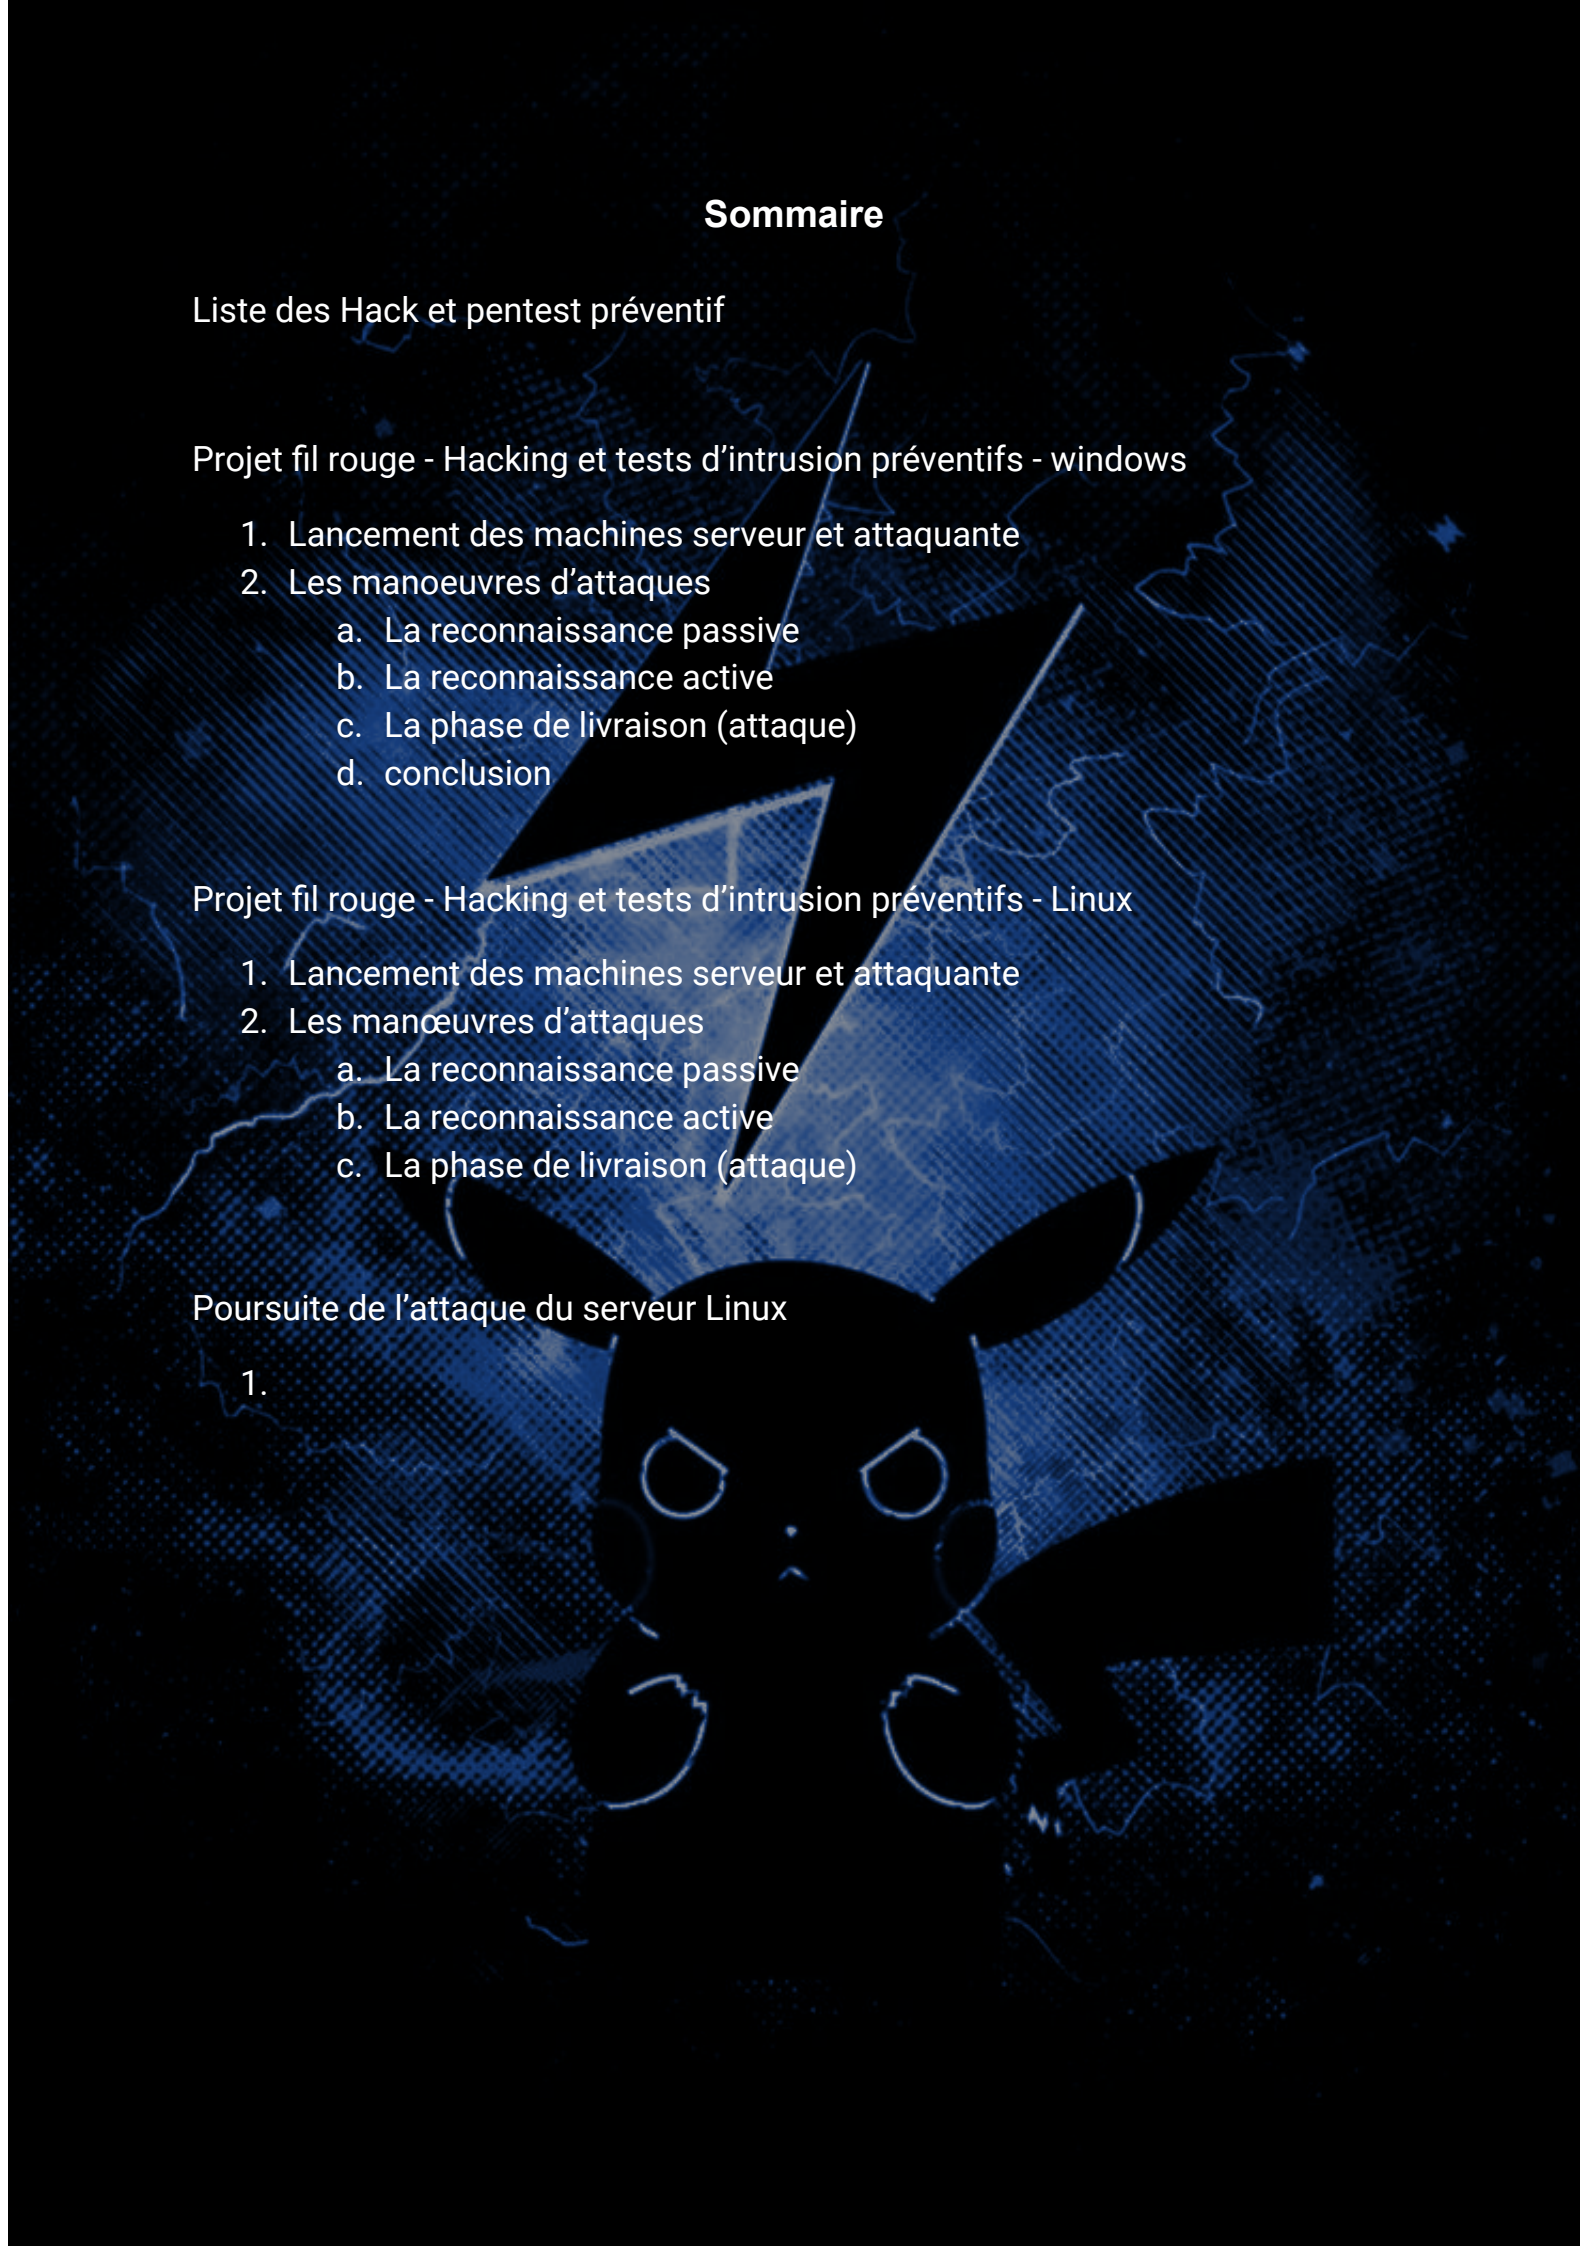
Pour le dossier Linux :
Appliquer l'énumération - En cours

Pour la suite de l'attaque :
Appliquer l'énumération - à faire
Agrémenter cette partie

Hacking et tests d'intrusion préventifs

En coopération avec

Sommaire

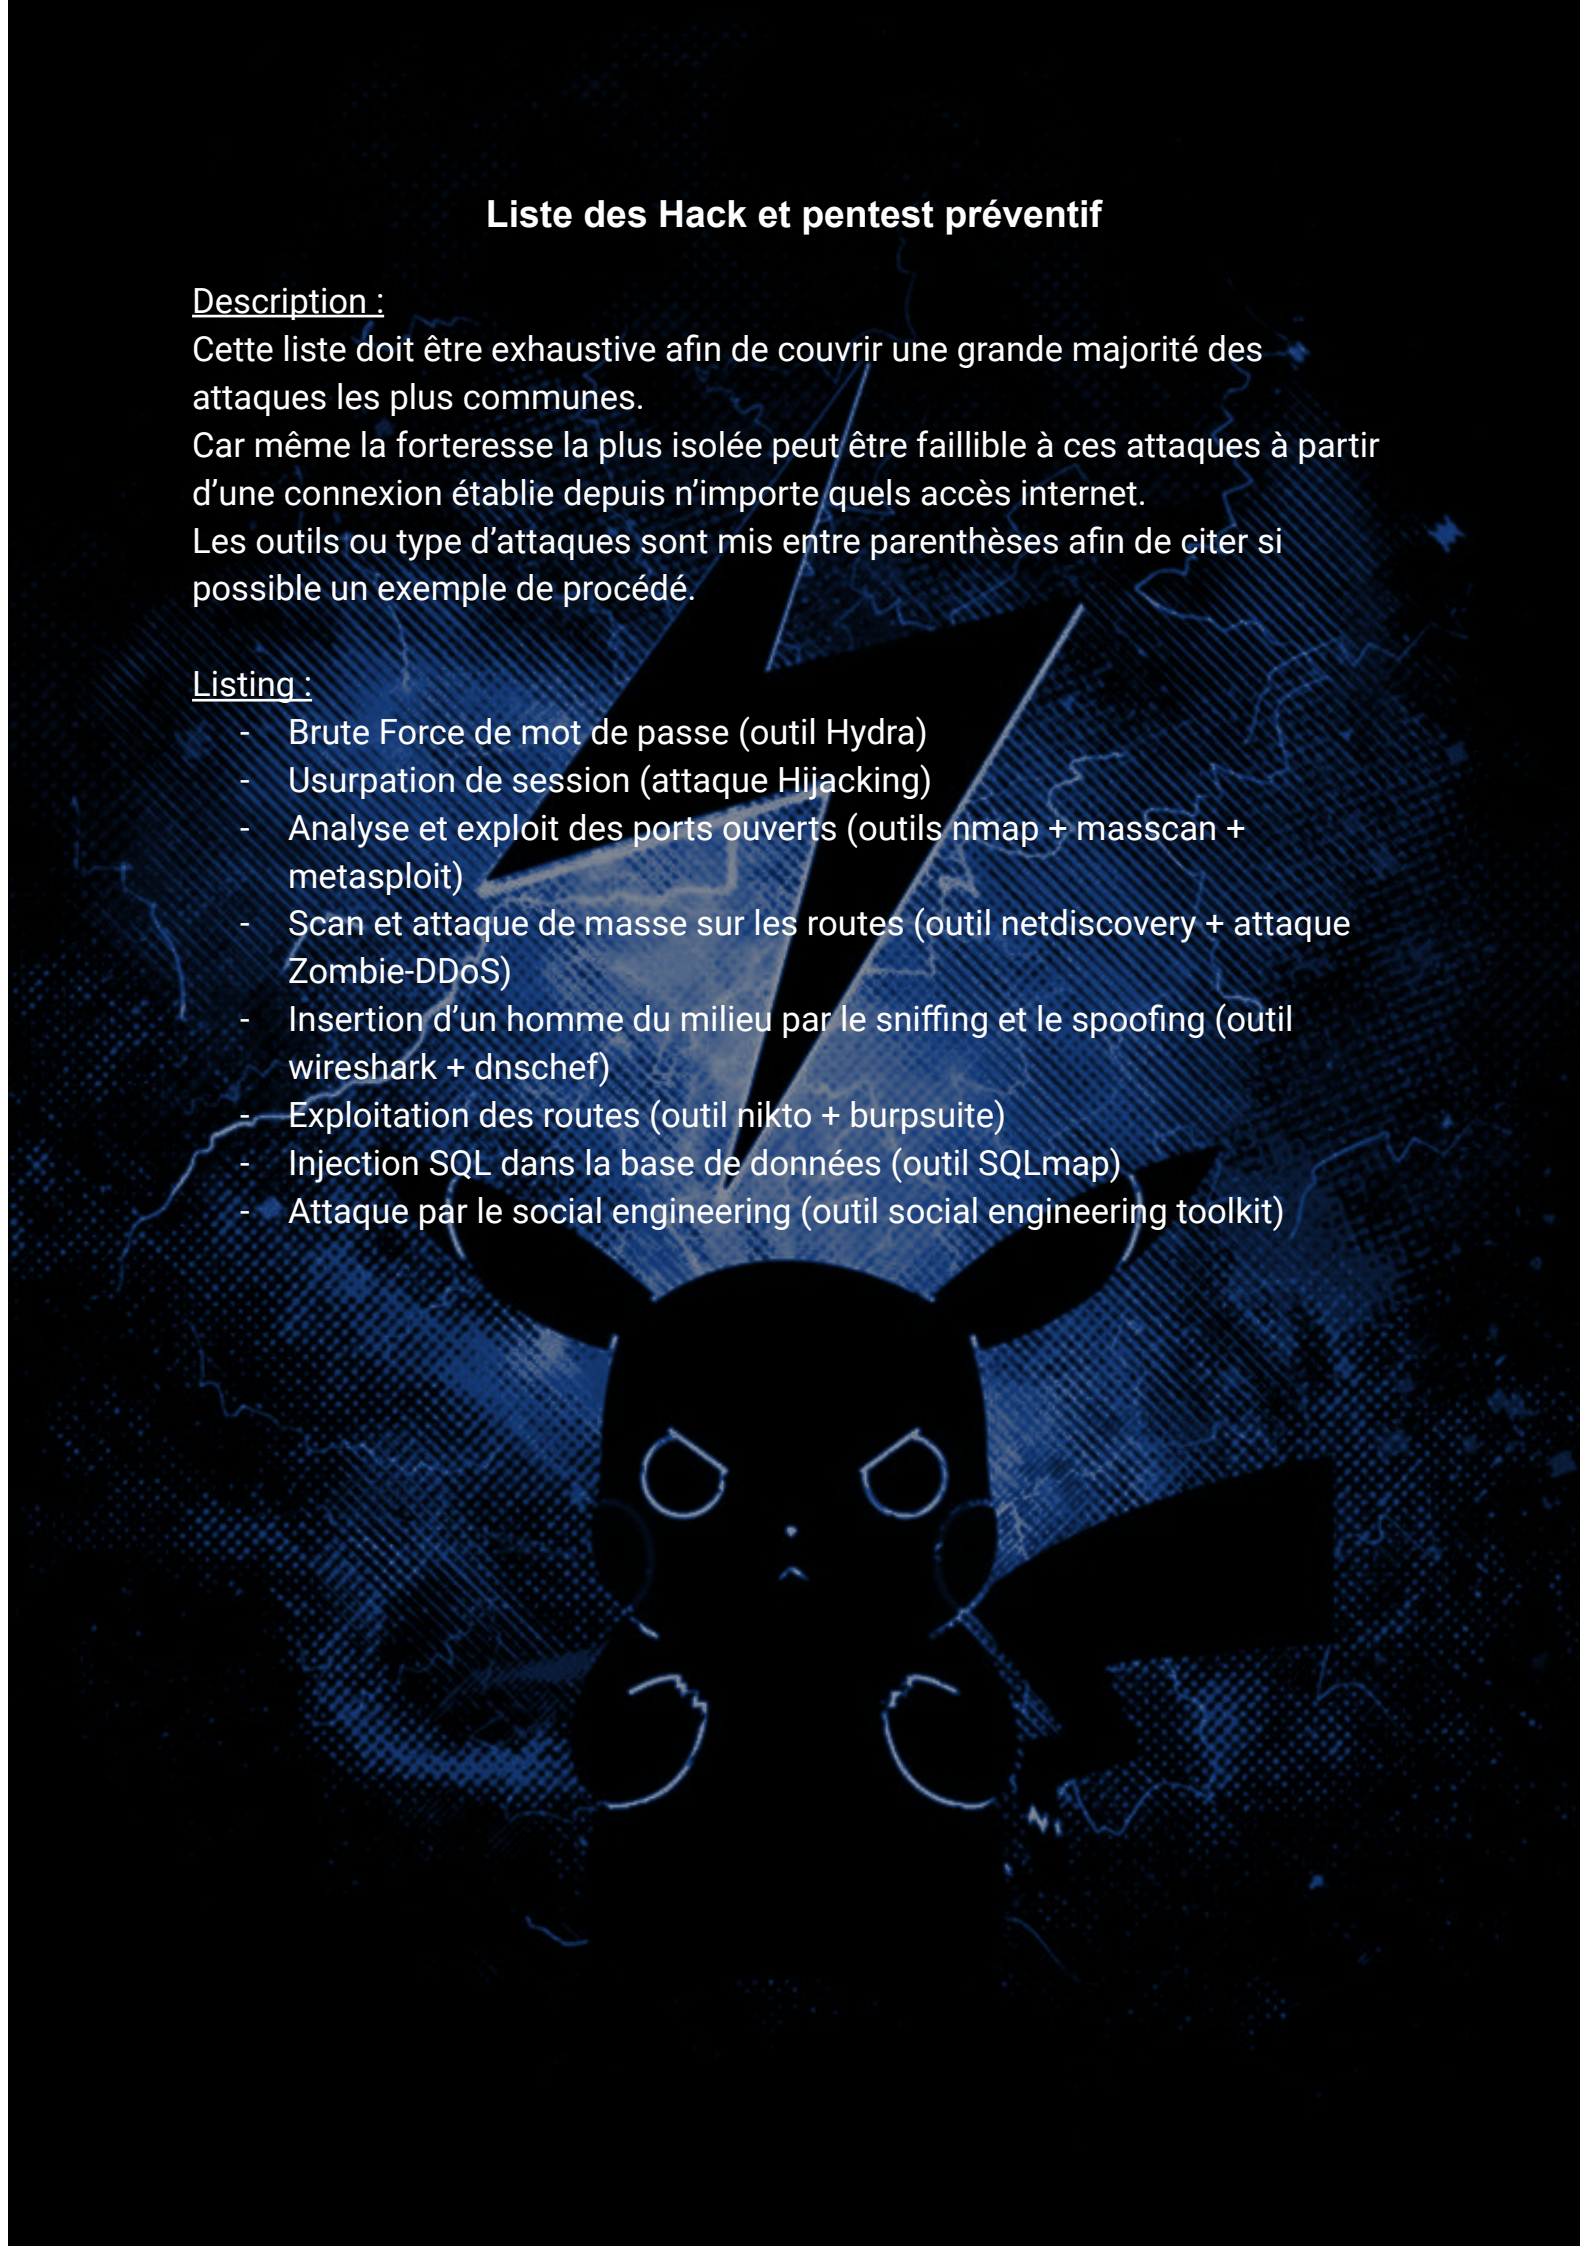


Liste des Hack et pentest préventif

Description :
Cette liste doit être exhaustive afin de couvrir une grande majorité des attaques les plus communes.
Car même la forteresse la plus isolée peut être faillible à ces attaques à partir d'une connexion établie depuis n'importe quels accès internet.
Les outils ou type d'attaques sont mis entre parenthèses afin de citer si possible un exemple de procédé.

Listing :

- Brute Force de mot de passe (outil Hydra)
- Usurpation de session (attaque Hijacking)
- Analyse et exploit des ports ouverts (outils nmap + masscan + metasploit)
- Scan et attaque de masse sur les routes (outil netdiscovery + attaque Zombie-DDoS)
- Insertion d'un homme du milieu par le sniffing et le spoofing (outil wireshark + dnschef)
- Exploitation des routes (outil nikto + burpsuite)
- Injection SQL dans la base de données (outil SQLmap)
- Attaque par le social engineering (outil social engineering toolkit)

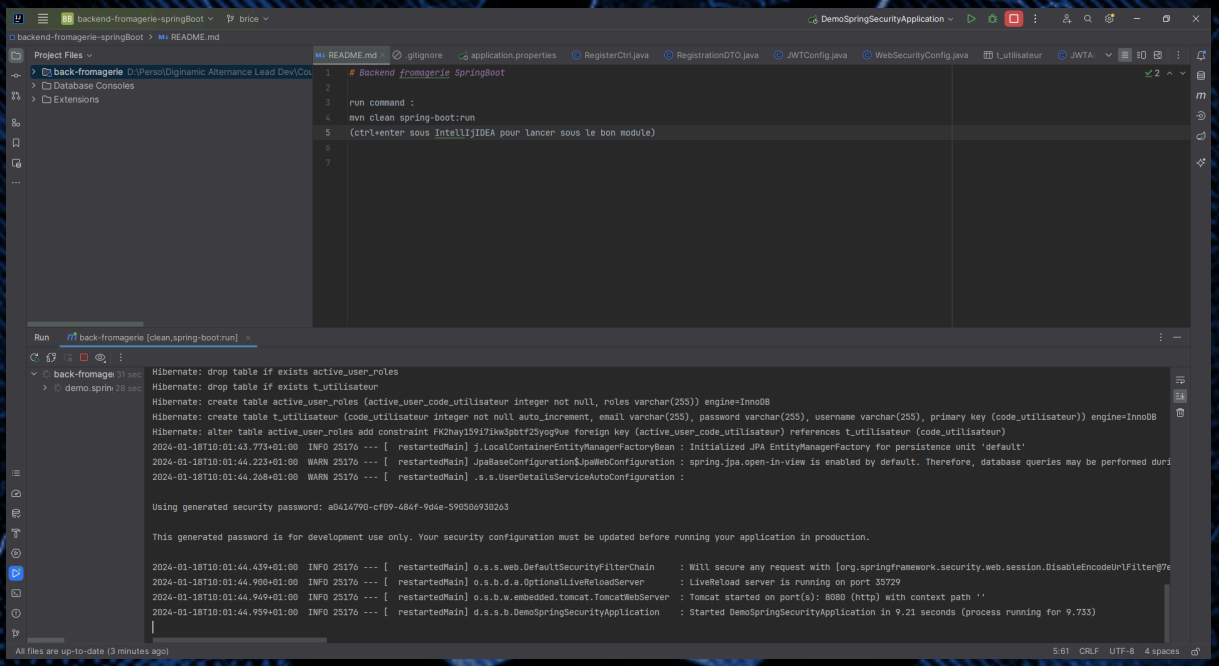


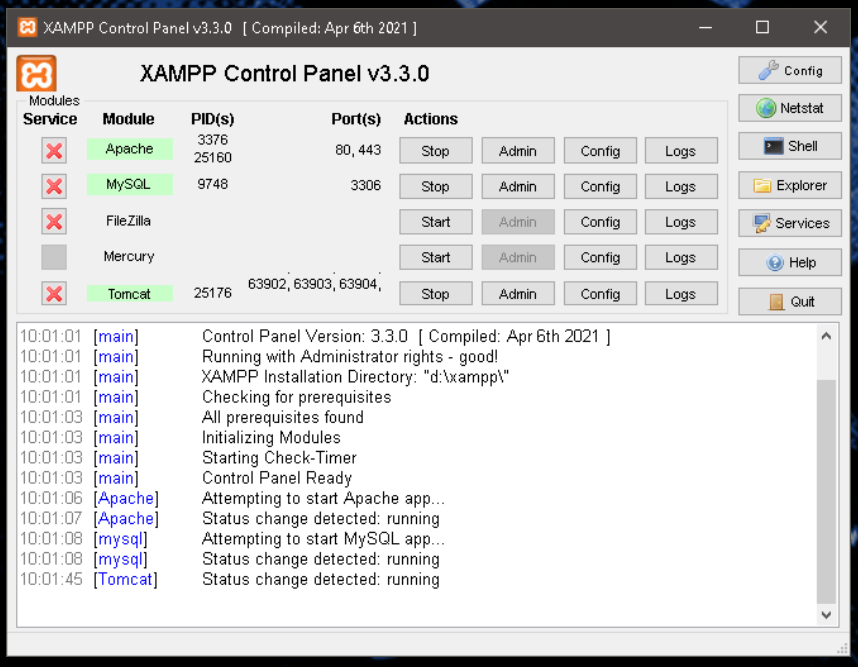
Projet fil rouge - Hacking et tests d’intrusion préventifs - windows

Start - 2024-01-18 09:57:50
End - 2024-01-18 16:36:40

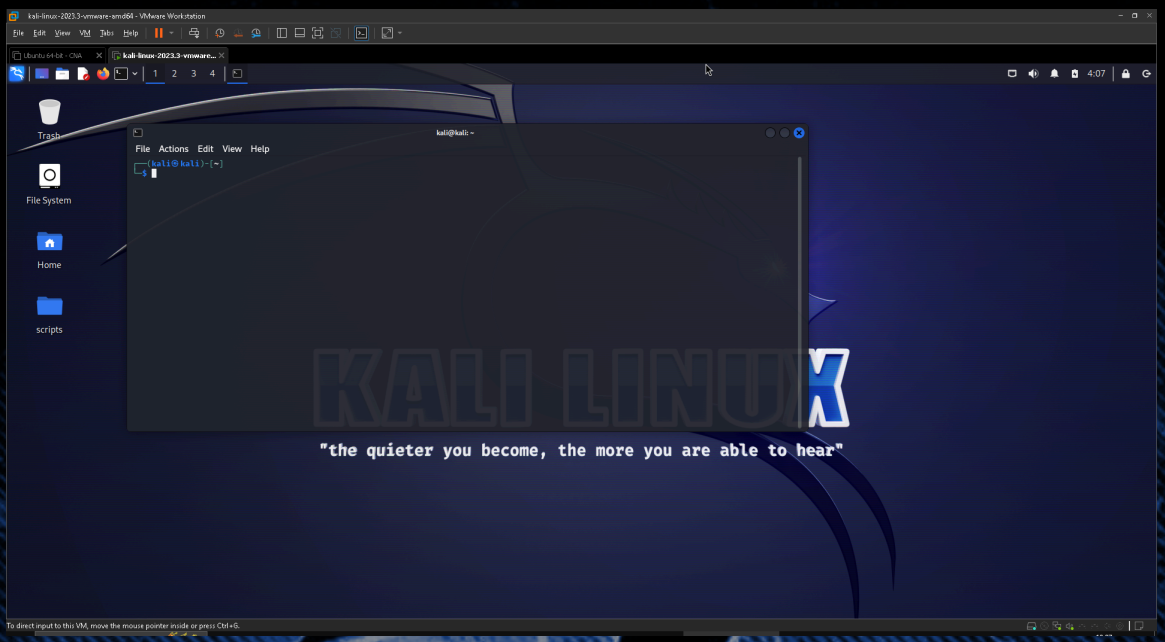
2. Lancement des machines serveur et attaquante

Lancement du serveur et de la BDD sur machine locale effectué à 10:01:44 :

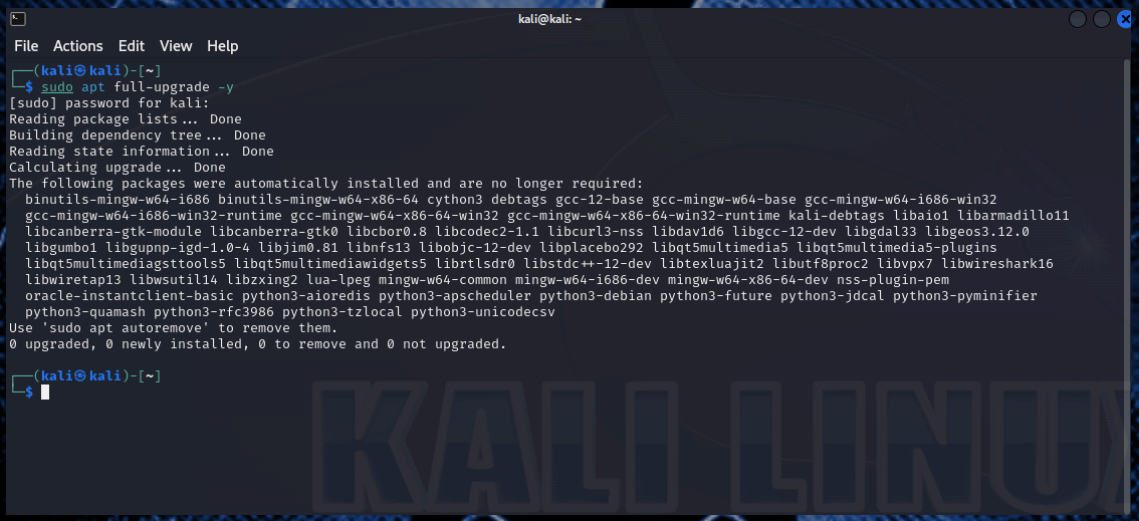




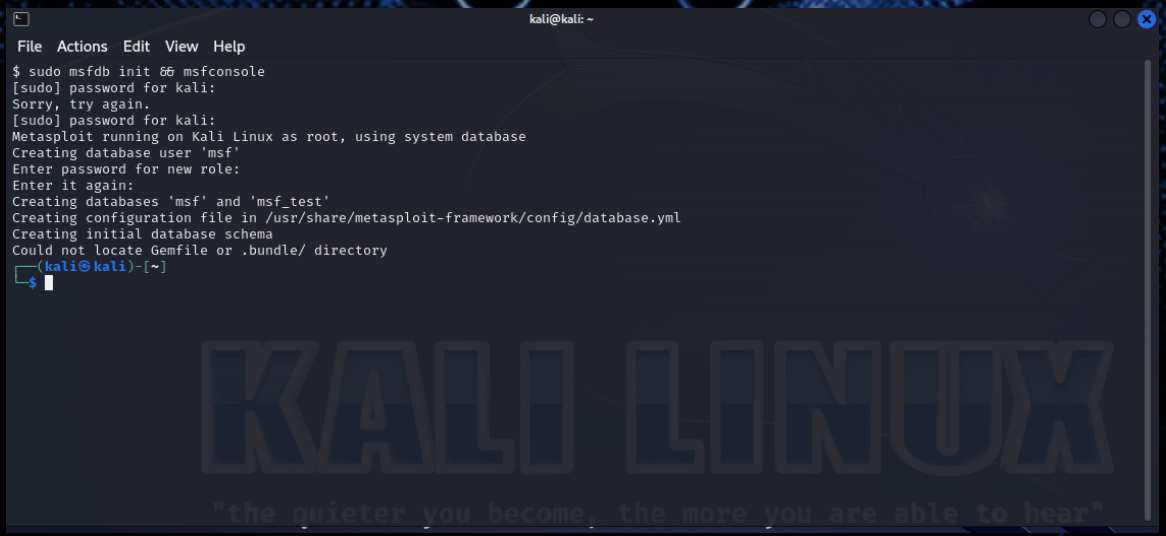
Lancement de la machine attaquante Kali Linux sur machine virtuelle à 10:07:00 :



mise à jour de la M.A (machine attaquante) effectué :



démarrage de l'outil d'attaque Metasploit effectué :



configuration réseau de l’attaquant :

```
┌──(kali㉿kali)-[~]
└─$ ifconfig
eth0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 1500
        inet 192.168.164.129  netmask 255.255.255.0  broadcast 192.168.164.255
        inet6 fe80::e2dd:f579:6d99:e09f  prefixlen 64  scopeid 0x20<link>
        ether 00:0c:29:72:6e:e5  txqueuelen 1000  (Ethernet)
        RX packets 19  bytes 17098 (16.6 KiB)
        RX errors 0  dropped 0  overruns 0  frame 0
        TX packets 47  bytes 22651 (22.1 KiB)
        TX errors 0  dropped 0 overruns 0  carrier 0  collisions 0

lo: flags=73<UP,LOOPBACK,RUNNING>  mtu 65536
        inet 127.0.0.1  netmask 255.0.0.0
        inet6 ::1  prefixlen 128  scopeid 0x10<host>
        loop  txqueuelen 1000  (Local Loopback)
        RX packets 4  bytes 240 (240.0 B)
        RX errors 0  dropped 0  overruns 0  frame 0
        TX packets 4  bytes 240 (240.0 B)
        TX errors 0  dropped 0 overruns 0  carrier 0  collisions 0
```

ip attaquant : 192.168.164.129
ip serveur attaqué : 192.168.56.1

3. Les manœuvres d’attaques

vidéo emprunté pour les manoeuvres :
Piratage éthique avec Kali GNU Linux et Metasploit (français)

a. La reconnaissance passive

test de la connectivité de l’attaquant avec la commande ping :

```
┌──(kali㉿kali)-[~]
└─$ ping 192.168.56.1
PING 192.168.56.1 (192.168.56.1) 56(84) bytes of data.
64 bytes from 192.168.56.1: icmp_seq=1 ttl=128 time=39.9 ms
64 bytes from 192.168.56.1: icmp_seq=2 ttl=128 time=0.992 ms
64 bytes from 192.168.56.1: icmp_seq=3 ttl=128 time=0.727 ms
64 bytes from 192.168.56.1: icmp_seq=4 ttl=128 time=0.740 ms
64 bytes from 192.168.56.1: icmp_seq=5 ttl=128 time=0.735 ms
64 bytes from 192.168.56.1: icmp_seq=6 ttl=128 time=0.629 ms
64 bytes from 192.168.56.1: icmp_seq=7 ttl=128 time=0.655 ms
64 bytes from 192.168.56.1: icmp_seq=8 ttl=128 time=0.716 ms
64 bytes from 192.168.56.1: icmp_seq=9 ttl=128 time=0.733 ms
64 bytes from 192.168.56.1: icmp_seq=10 ttl=128 time=0.736 ms
64 bytes from 192.168.56.1: icmp_seq=11 ttl=128 time=0.728 ms
64 bytes from 192.168.56.1: icmp_seq=12 ttl=128 time=0.716 ms
64 bytes from 192.168.56.1: icmp_seq=13 ttl=128 time=0.695 ms
64 bytes from 192.168.56.1: icmp_seq=14 ttl=128 time=0.678 ms
64 bytes from 192.168.56.1: icmp_seq=15 ttl=128 time=0.852 ms
64 bytes from 192.168.56.1: icmp_seq=16 ttl=128 time=0.697 ms

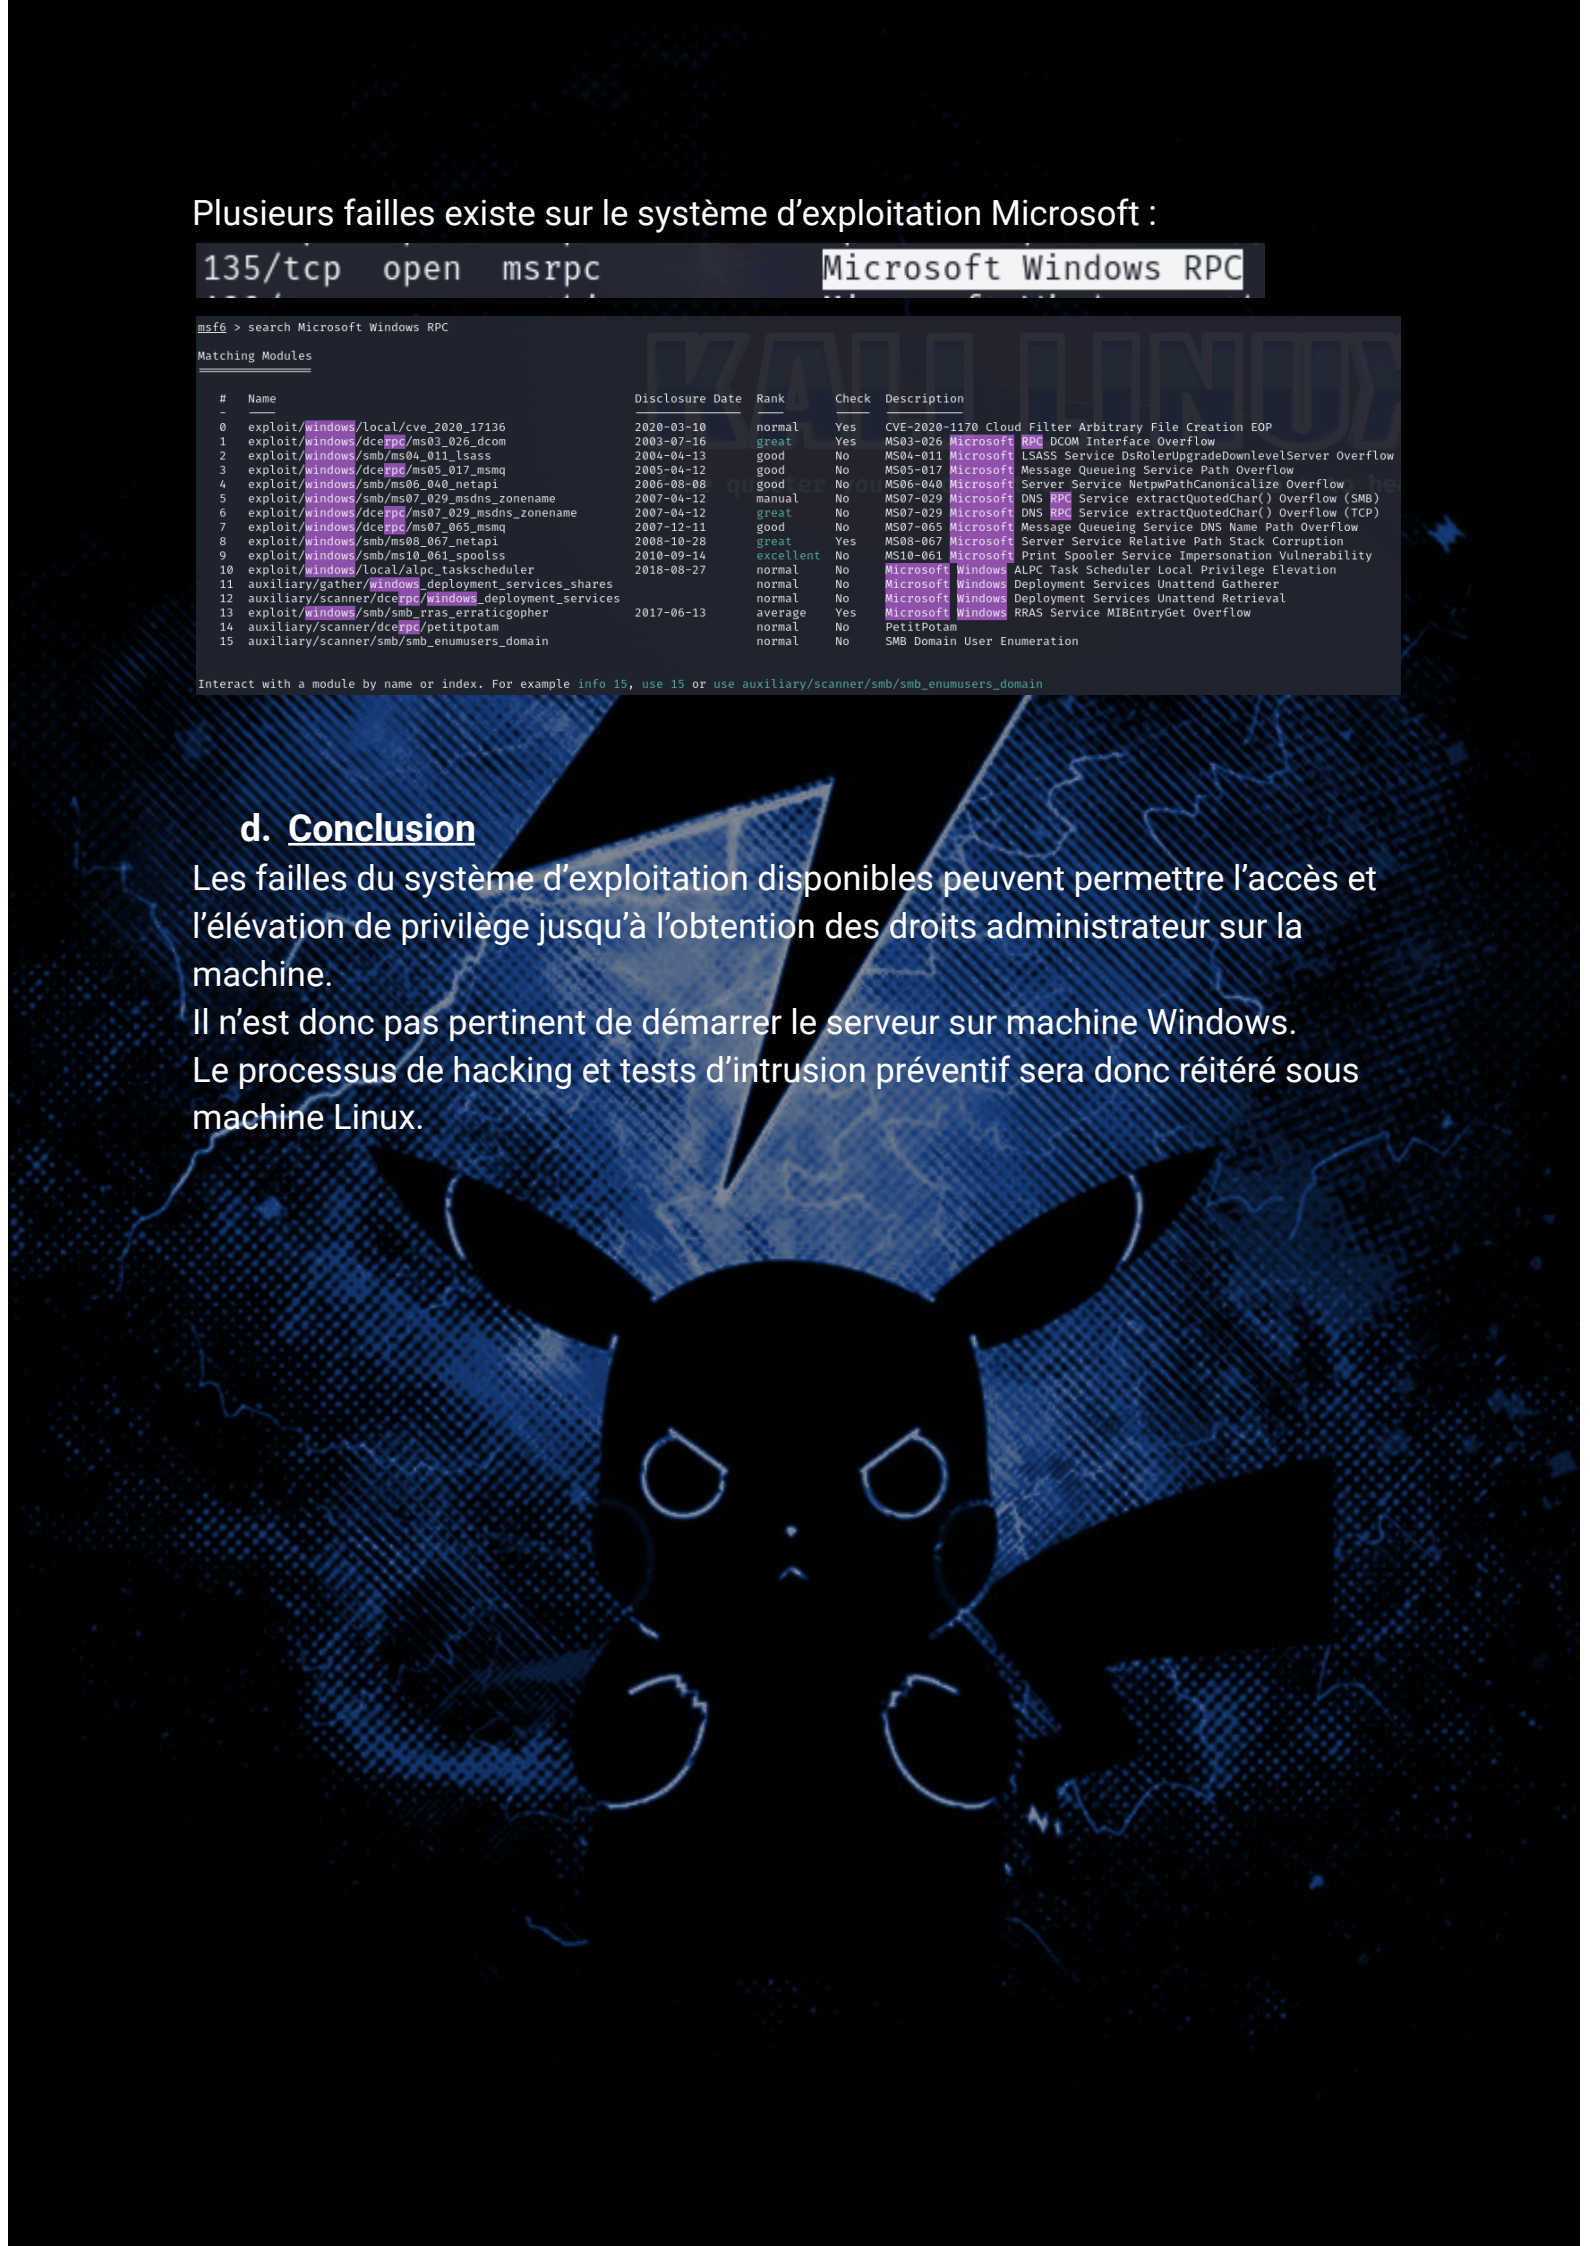
d. Conclusion

Les failles du système d'exploitation disponibles peuvent permettre l'accès et l'élévation de privilège jusqu'à l'obtention des droits administrateur sur la machine.
Il n'est donc pas pertinent de démarrer le serveur sur machine Windows.
Le processus de hacking et tests d'intrusion préventif sera donc réitéré sous machine Linux.



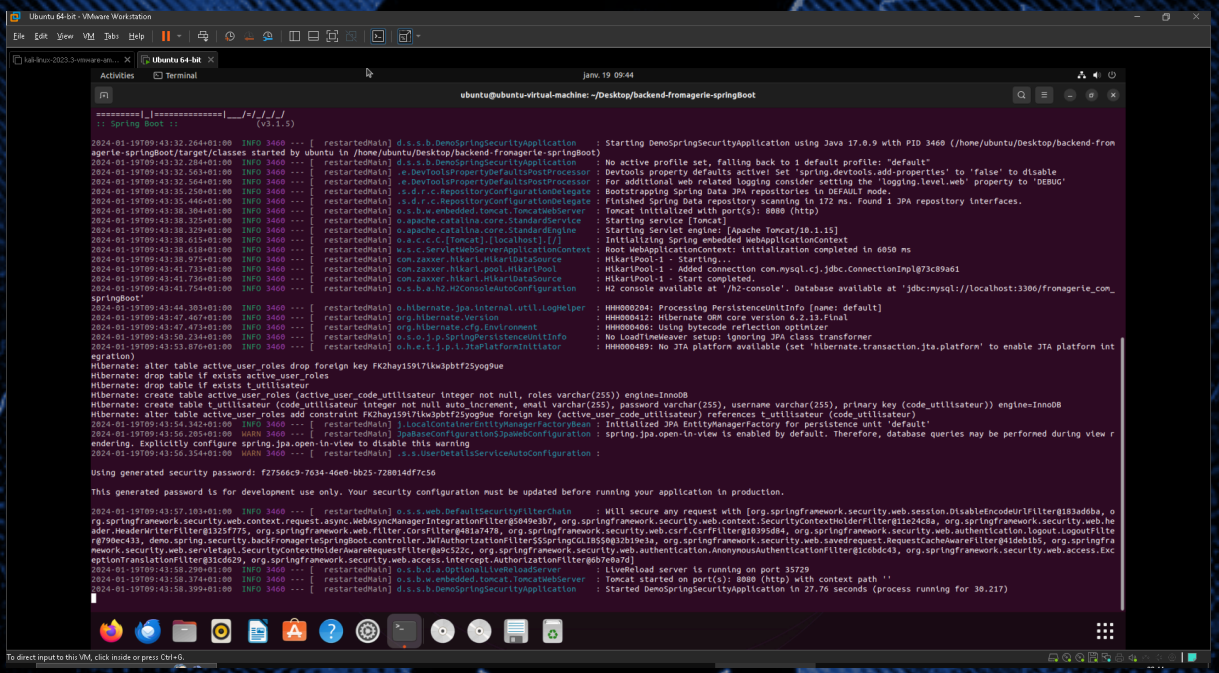
Projet fil rouge - Hacking et tests d’intrusion préventifs - ubuntu

Start - 2024-01-19 09:30:00
End - 2024-01-19 18:00:00

1. Lancement des machines serveur et attaquante

Le serveur installé et lancé sur machine virtuelle Linux Ubuntu v.22.04.2 Desktop mis à jour (avec les commandes : ‘sudo apt update’ et ‘sudo apt full-upgrade -y’), nous procédons aux essais.

Serveur :



```

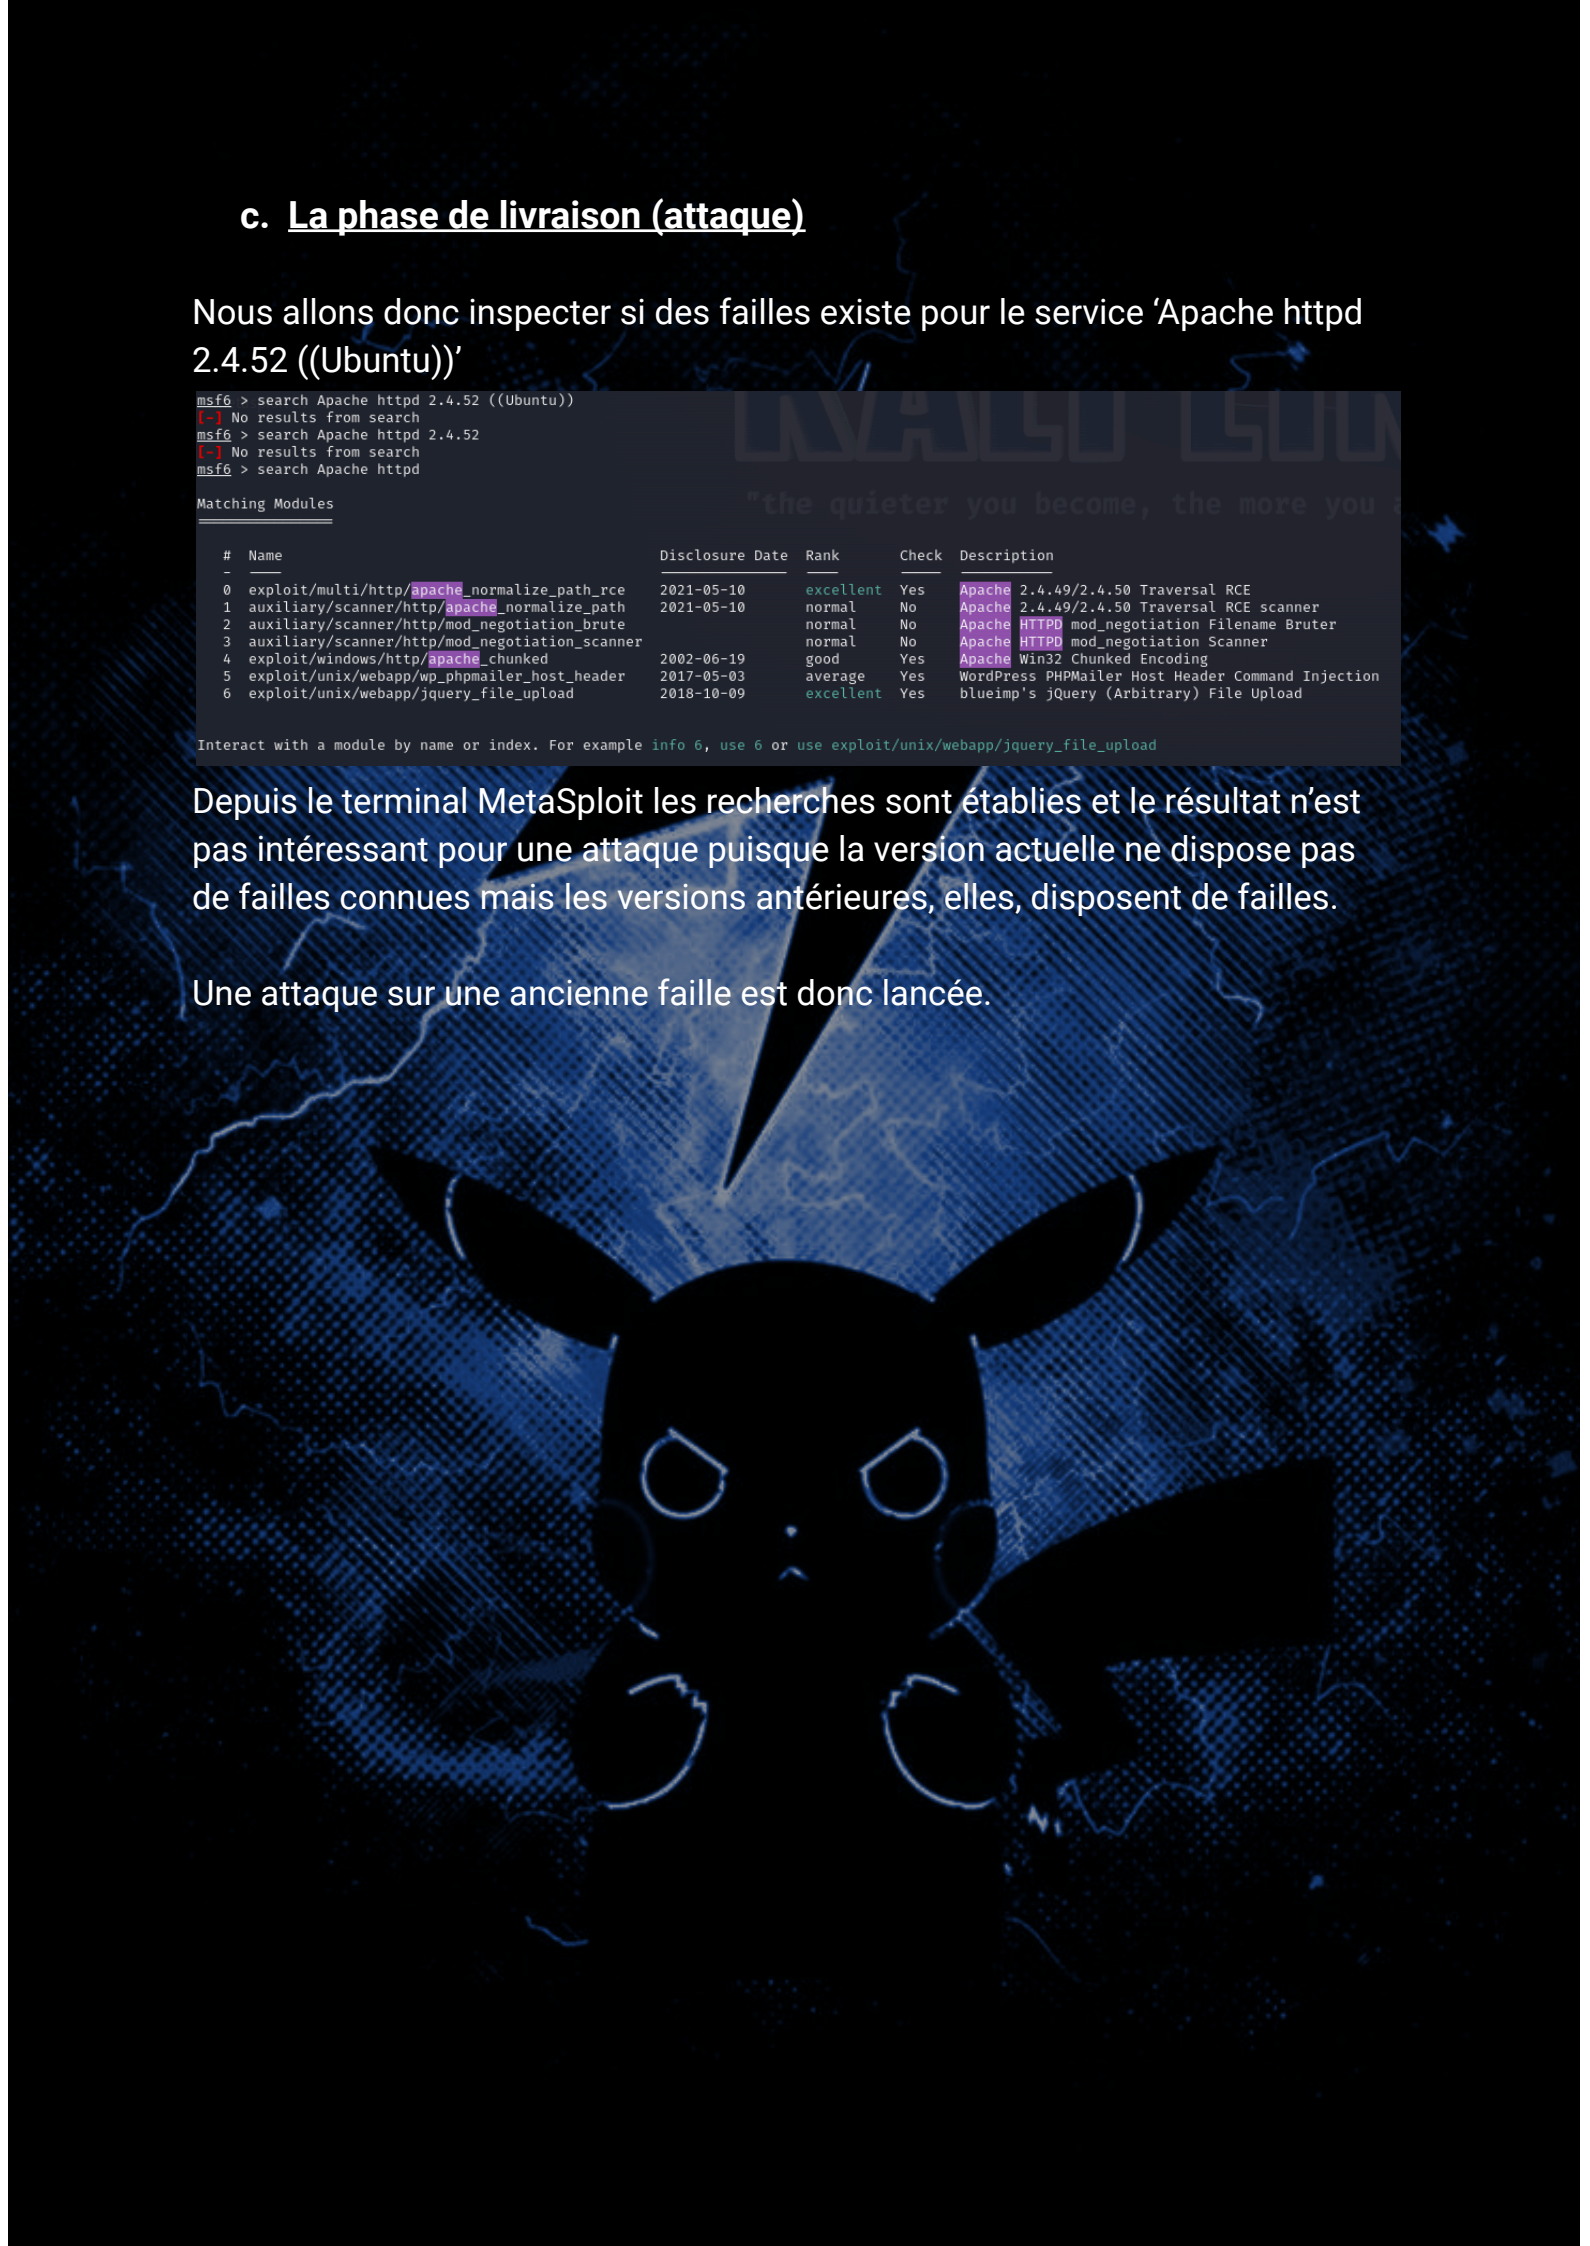
Interact with a module by name or index. For example info 6, use 6 or use exploit/unix/webapp/jquery_file_upload
```

Depuis le terminal MetaSploit les recherches sont établies et le résultat n’est pas intéressant pour une attaque puisque la version actuelle ne dispose pas de failles connues mais les versions antérieures, elles, disposent de failles.

Une attaque sur une ancienne faille est donc lancée.



La première présenté est étudié :

```

Payload information:

Description:
  This module exploit an unauthenticated RCE vulnerability which exists in Apache version 2.4.49 (CVE-2021-41773).
  If files outside of the document root are not protected by 'require all denied' and CGI has been explicitly enabled,
  it can be used to execute arbitrary commands (Remote Command Execution).
  This vulnerability has been reintroduced in Apache 2.4.50 fix (CVE-2021-42013).

View the full module info with the info -d command.
```

Dans un premier temp cette première faille à fait son apparition :
https://nvd.nist.gov/vuln/detail/CVE-2021-41773

Puis elle est réapparue dans un fix :
https://nvd.nist.gov/vuln/detail/CVE-2021-42013

Avec la commande ‘info -d [lien de l’exploitation]’, une documentation est téléchargée afin de mieux comprendre le fonctionnement.

Verification Steps

1. Start `msfconsole`
2. `use exploit/multi/http/apache_normalize_path_rce`
3. `set RHOSTS [IP]`
4. `set LHOST [IP]`
5. `run`

Options

CVE

The vulnerability to use (Accepted: CVE-2021-41773, CVE-2021-42013). Default: CVE-2021-42013

DEPTH

Depth for path traversal. Default: 5

TARGETURI

Base path. Default: `/cgi-bin`

Scenarios

Command Line Interface

```

Pas de réaction côté serveur, pas d’accès ouvert et ni crash de celui-ci, cette vulnérabilité semble être écartée également.

Nous allons donc nous attaquer à la machine du serveur.
